

FALMOUTH MARINA IMPROVEMENTS

About the Project

ACME Marinas will be improving the existing dock and facilities at the Falmouth Marina located at 278 Scranton Avenue to modernize the marina and better serve the community. The proposed project involves installation of new floating piers, new fixed piers, new steel pipe piles, and new vinyl coated piles. The proposed project will result in a reduction of 276 square feet in the pier footprint and will reduce the size of the pile footprint by 151 square feet. The improvement activities also will require dredging in the Falmouth Harbor.

The project activities are anticipated to begin in 2025 and completion is anticipated in 2026. Minor truck traffic is anticipated to deliver materials during construction, although no truck traffic will travel within residential neighborhoods. The contractors will follow Best Management Practices during construction and follow applicable local and state regulations to avoid and/or minimize impacts to wetland resource areas, air quality, and noise generation.

Public input is welcomed through attendance at regularly scheduled public hearings and/or reaching out directly to our project team.
